The upcoming videos ("**1.12 ElectraHub Case Study - Univariate Analysis - Hands-on**" and "**1.13 ElectraHub Case Study - Bivariate Analysis - Hands-on**") covers the summary statistics, univariate analysis, and bivariate analysis of the dataset provided for the problem at hand.

Since these concepts were covered in detail in the previous course, the corresponding videos are OPTIONAL and can be skipped. You can feel free to move forward to the video "**1.14 ElectraHub Case Study - Multivariate Analysis - Hands-on**", where we'll be covering correlation and how the insights from the same guide the linear regression modeling workflow.

- A summary page has been provided with each of the aforementioned videos for your reference, allowing you to quickly review the key insights before proceeding to subsequent videos.

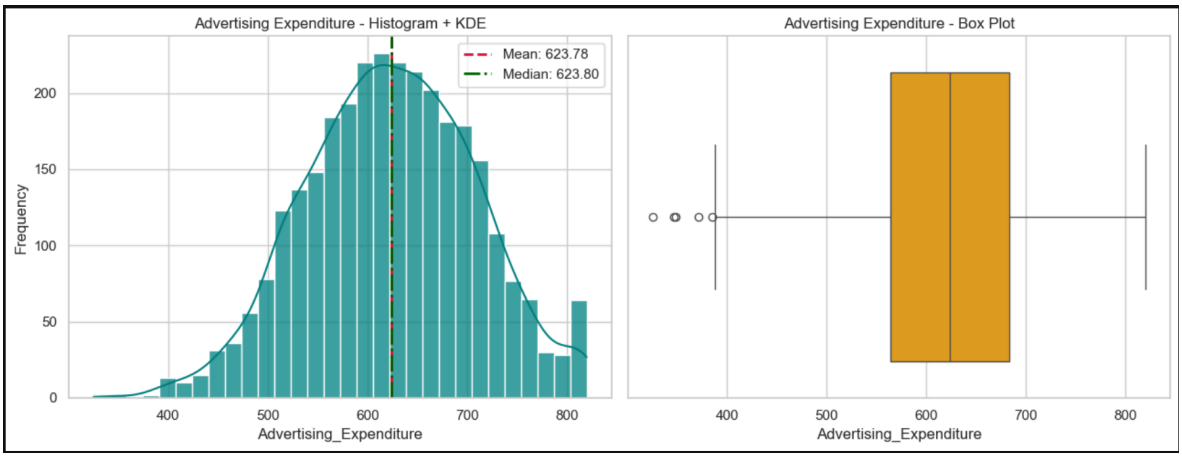

Sales Distribution

Examines the distribution and central tendency of sales values.

Observations

- Most sales values are concentrated between 20,000 and 35,000.
- A few products have noticeably lower sales than the majority of products.
- The distribution is approximately bell-shaped with only slight skewness.

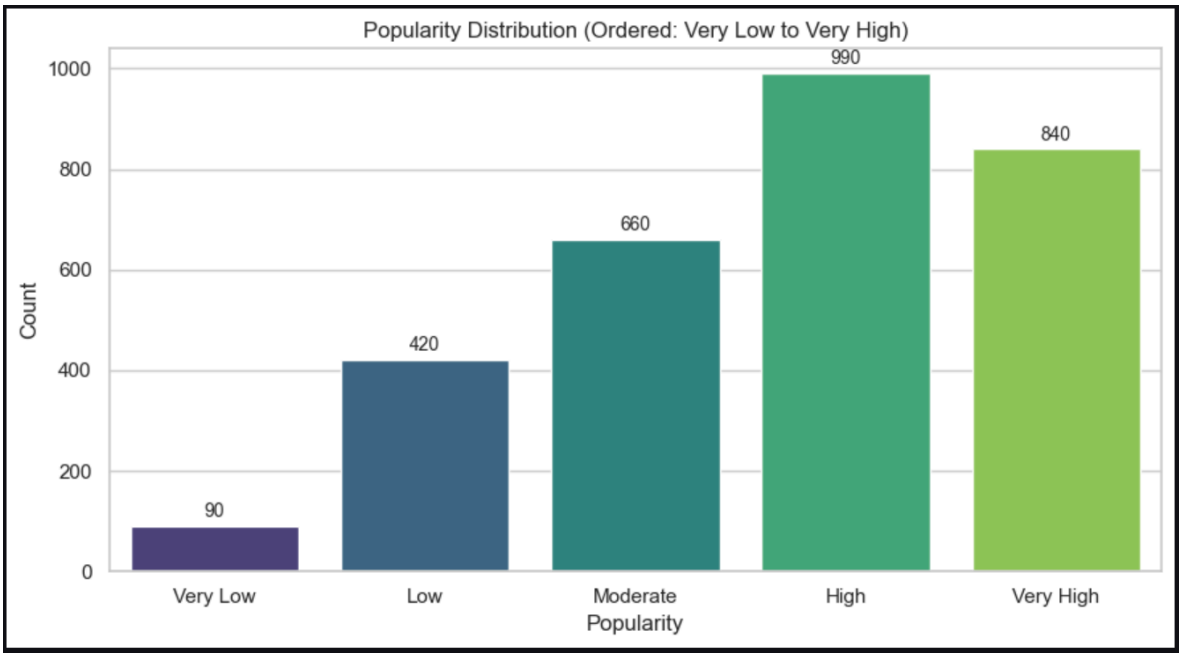

Observations

- Most advertising expenditure values fall between 500 and 700 units.
- The distribution is approximately symmetric, with the mean and median being nearly identical.
- A few products have unusually low advertising expenditure compared to the rest of the dataset.

Popularity Distribution

Shows the frequency of products across popularity categories.

Observations

- The High popularity category contains the largest number of products.
